

Opportunity Dataset

Insights & Interpretation Report

Prepared by: **Team 1**

Program: *Excelerate - Data Visualization Trainee Program*

Week 3 Deliverable | 0308 SLU DVT Team 1

Live Dashboard: [Team1 Opportunity Dashboard \(Power BI\)](#)

Active Team Members

Name	Role	Contribution
Queen Bella	Data Cleaning, Research, & Visualization	Trend and location analysis. Provide a detailed analysis for the dashboard
Aman Gupta	Data Cleaning, Visualization& Analysis	Summary statistics and data quality checks, and Suggest the KPI for dashboard
Fatima Saifuddin	Data Dictionary & Visualization	Charts and visual analysis section, prepare the overview for the dashboard
Abiodun Michael Ogunleye	Analysis & Visualization Review, Documentation, and Project Coordination	Built the dashboard based on team reviewed analysis and visualizations; compiled this report and coordinated final submission

1. Overview of the Dashboard

The interactive Power BI dashboard presents the Week 1 cleaned dataset and Week 2 EDA findings in a single, navigable view. It covers 1,542 production-representative opportunities - the same filtered base used throughout the Week 2 EDA Report, after excluding 4,186 records flagged as test, demo, or automation-generated during Week 1 cleaning.

The dashboard opens with five key metric cards: total opportunities analyzed (1,542), the highest sign-up quarter (2025 Q4), the lowest sign-up quarter (2022 Q4), the share of opportunities carrying a scholarship (74.5%), and the top category by volume (Internship, 803 records, 52.1%). Below that sit six charts covering location, category volume, sign-up trend over time, scholarship availability, median scholarship value by category, and how scholarship status breaks down within each category. Category, Quarter, Location, and Scholarship slicers let a viewer filter the whole page interactively. An Overview panel and a dedicated data-gap card close out the page, summarizing the findings and disclosing the one metric the dataset cannot support.

2. Key Trends and Observations

2.1 Opportunity Sign-Up Trends

Sign-up activity is cyclical rather than steady. The highest quarter is 2025 Q4, with 263 opportunities created - more than 25 times the lowest quarter, 2022 Q4, which recorded only 2. A second, smaller peak occurs in 2023 Q1 (228), and

both peaks are followed by multi-quarter declines rather than sustained growth, most visibly the drop to 34 opportunities in 2024 Q4 before the 2025 Q4 recovery.

2.2 Application Distribution by Location

Work From Home (644) and Virtual (509) together account for 75% of all opportunities with a recorded location, confirming remote formats dominate the platform. A meaningful gap remains in the data itself: 387 records (25% of the analyzed set) have no location specified at all - large enough that, if it were a real category, it would rank third overall. This is treated on the dashboard as a labeled data-completeness issue ("Not Specified"), not folded silently into either remote-format count.

2.3 Outreach Channel Performance

This could not be analyzed and is disclosed as such on the dashboard rather than estimated. The dataset has no field recording how a participant discovered an opportunity - no channel, campaign, or referral-source column exists anywhere in the 36 columns produced by Week 1 cleaning. The dashboard's data-gap panel sets out exactly what would need to be added (a channel/source field and application-level records) before this question can be answered.

2.4 Scholarship Distribution

74.5% of opportunities carry a positive scholarship value; only 25.5% show zero, and a negligible 0.06% have no recorded status at all. Value is not distributed in proportion to volume: Course carries the highest typical (median) scholarship value at 120, while Internship - the platform's largest category by far - sits mid-range at 42. JobSimulation is the lowest at 6. Two extreme outlier values (500,000,000 and 10,000,000) were excluded from this comparison, consistent with the Week 2 EDA Report; both remain flagged in the underlying dataset for manual review rather than deleted.

2.5 Scholarship Status Within Category

Breaking scholarship status down by category shows the 74.5% platform-wide rate holds fairly consistently across the larger categories rather than being driven by one or two of them. Internship, the largest category, splits 591 Has Scholarship to 212 No Scholarship (about 74% has-rate) - closely in line with the platform average. No category in the top group stands out as dramatically over- or under-scholarshipped relative to its size, which suggests scholarship eligibility is applied fairly evenly rather than concentrated in specific categories.

3. Important Insights Supported by Visual Evidence

- The platform's growth is not linear. Two distinct sign-up spikes, roughly two years apart, both followed by extended declines, is a stronger and more actionable signal than any single "average per quarter" figure would show - visible directly on the trend chart's shape, not just its endpoints.
- Category concentration compounds through the whole dashboard. Internship's 52.1% share (Opportunity by Category) reappears as the tallest bar in the Category and Scholarship breakdown - a single dominant category is driving multiple charts at once, which is worth knowing before drawing conclusions from any one of them in isolation.
- Volume and scholarship value move independently. The scholarship-by-category chart and the category-volume chart tell two different stories from the same dataset - the category with the most opportunities (Internship) is not the category with the richest typical scholarship (Course). A dashboard viewer relying on category volume alone would miss this.

- Scholarship availability is stable across categories. Rather than being concentrated in a few categories, the roughly 3-to-1 Has-to-No-Scholarship ratio shows up consistently from Internship down through the smaller categories, indicating a platform-wide policy rather than category-specific treatment.

4. Recommendations Based on the Findings

- Investigate what drove the 2023 Q1 and 2025 Q4 sign-up spikes. If they trace back to a repeatable cause (a recruitment cycle, partner onboarding, or seasonal launch), that timing could inform a future publishing calendar; if they were one-off bulk imports, they should be excluded from any "typical quarter" metric used in reporting.
- Prioritize completing the location field for the 387 unspecified records before location-based decisions are made - this is currently one of the more reliable fields in the dataset, and the gap limits how confidently it can be used.
- Add a discovery/outreach channel field to the data collection process. This is the single largest gap preventing this dashboard from answering acquisition and marketing-effectiveness questions, and it cannot be resolved through analysis of the existing fields.
- Confirm whether scholarship values are currency-denominated before using the scholarship-by-category comparison for any funding decision - median values differ by currency (USD 120, EUR 67, INR 49) when cross-referenced against the fee field's currency_type, and this has not yet been confirmed with the data owner.
- Add a category-by-location breakdown in a future dashboard iteration. This version prioritized category-by-scholarship instead; both are valid relationship views, and location-by-category would extend the analysis further by confirming whether the Work From Home preference identified in Week 2 holds uniformly across every category.
- Carry the fee_flag, quality_review_flag, and is_test_or_placeholder columns from Week 1 into future dashboard iterations as filterable fields, so a viewer can toggle flagged records in or out rather than having them silently included or excluded.

5. Summary of the Overall Analysis

Across sign-up timing, location, category, and scholarship value, the same underlying pattern holds: this is a concentrated, cyclical dataset rather than an evenly distributed, steadily growing one. A small number of categories, quarters, and location types account for a disproportionate share of activity, and the dashboard is built to make that concentration visible rather than averaged away.

Two genuine data gaps - outreach channel performance and the 387 unspecified locations - are surfaced directly on the dashboard rather than filled in with assumptions, consistent with the non-destructive, transparency-first approach Team 1 used throughout Week 1 and Week 2. Team 1 recommends this dashboard, together with the recommendations in Section 4, be treated as the baseline for any further reporting or decision-making built on this dataset.
